

# Html Extras

## Snow Script – Falling images

This assignment is designed to show you that there is more to creating a web page than just simple HTML; there are codes/scripts that can be added to simple HTML coded websites. For example, I have created a web page using the “snow script” found on <http://www.dynamicdrive.com> and I used an image of Chiles and set it as the background; this is to be your example.

First, you will create a new folder in your OneDrive folder titled, '**HTML EXTRAS**'. Then inside that new folder (HTML EXTRAS), created another new folder and title it, '**Snow Script**'. Now you will save all work and images inside the 'Snow Script' folder for the snow storm at Chiles web page.

Take a look at the example page I created and then begin to create your own snow storm at Chiles web page using the code found at <http://www.dynamicdrive.com/dynamicindex3/snow.htm>. You can use the same background image from the example or another image of Chiles if you so choose but, it must have the dimensions of 1600 wide and 900 height.

Once you have re-created your own snow storm at Chiles web page and it is saved in your OneDrive folder following all the instructions stated above, then you will created another folder inside the 'HTML EXTRAS' folder. This new folder will be titled '**Falling Images**' and will contain all work and images associated with web page. Now, you will create another web page similar to the snow storm page. However, this time you will use a different image (not snow.gif) but you will still use the same scripting code (just modify code to reflect the new file name of the new image). See my example title 'Falling Images' for a visual reference.
